

Python Variables – Basics

</> **Python Variables Cheat Sheet** *Quick Reference* Use this sheet to remember how Python handles variables, naming, scope, and output. Variables are containers for storing data values. Python creates variables when you assign them.

Dynamic Typing

Dynamic Typing
Variables can change type after assignment.

```
x = 4 int
x = "Sal 1" str
print(x)
```

Creating Variables

Creating Variables Python has no variable declaration command. A variable is created when assigned.

```
x = 5
y = "John"
print(x)
print(y)
```
